

# Tuples in Python

- Tuples are immutable, ordered collections of elements.
- They are defined using parentheses () and can hold multiple data types.

```

31 def __init__(self):
32     self.file = None
33     self.fingerprints = set()
34     self.logdups = True
35     self.debug = debug
36     self.logger = logging.getLogger(__name__)
37     if path:
38         self.file = open(os.path.join(path,
39         self.file.seek(0)
40         self.fingerprints.update(e.request
41
42 @classmethod
43 def from_settings(cls, settings):
44     debug = settings.getbool('SUPERFUTUR
45     return cls(job_dir(settings), debug)
46
47 def request_seen(self, request):
48     fp = self.request_fingerprint(request)
49     if fp in self.fingerprints:
50         return True
51     self.fingerprints.add(fp)
52     if self.file:
53         self.file.write(fp + os.linesep)
54
55 def request_fingerprint(self, request):
56     return request_fingerprint(request)

```

## Immutable Nature of Tuples

- Tuples cannot be changed after creation.
- A workaround: Convert a tuple into a list, modify it, and convert it back.

# Tuple Concatenation

- Tuples can be combined using the '+' operator.
- Example:  $(1, 2, 3) + (4, 5, 6) \rightarrow (1, 2, 3, 4, 5, 6)$

# Explain Tuple Manipulation from Ur own side

## Useful Tuple Functions

- `count()` returns the number of times a value appears.
- `index()` finds the first occurrence of a specified value.

# Tuple Slicing

- Slicing extracts a portion of a tuple.
- Example:  $(10, 20, 30, 40, 50)[1:4] \rightarrow (20, 30, 40)$

# Tuple Packing & Unpacking

- Packing stores multiple values in a tuple.
- Unpacking extracts values into separate variables.

# Membership Testing in Tuples

- Use 'in' and 'not in' to check if an element exists.
- Example: 3 in (1, 2, 3, 4) → True

```
le( 'lp-fotorama' );

yle( 'lp-stylesheet', get_stylesheet_directory_url() );
yle( 'lp-stylesheet' );

ts file in the footer
script('jquery');
script('jquery', 'https://ajax.googleapis.com/ajax/libs/jquery/3.5.1/jquery.min.js');
script('jquery');

script( 'lp-plugins', get_stylesheet_directory_url() );
script( 'lp-plugins' );

script( 'lp-js', get_stylesheet_directory_url() );
script( 'lp-js' );

script( 'lp-fotorama', 'https://cdnjs.cloudflare.com/ajax/libs/fotorama/4.5.0/fotorama.min.js' );
script( 'lp-fotorama' );

() {
t( 'post-thumbnails' );
'slider', 980, 420, true );
'banner', 980, 250, true );
'names_choose', 'my_custom_slider' );
```

## Finding Tuple Length

- `len()` counts the number of elements in a tuple.
- Example: `len((1, 2, 3, 4, 5)) → 5`

# Min, Max, and Sum Functions

- `min()` finds the smallest element.
- `max()` finds the largest element.
- `sum()` calculates the total sum.

## Sorting a Tuple

- sorted() returns a sorted list from a tuple.
- Example: sorted((5, 2, 8, 1, 7)) → [1, 2, 5, 7, 8]

# Nested Tuples

- Tuples can contain other tuples.
- Example:  $((1, 2, 3), (4, 5, 6))$
- Elements are accessed using indexing.
